A randomized, phase III study (FLAURA) of AZD9291, a novel EGFR-TKI, versus gefitinib or erlotinib in treatment-naïve patients with advanced non-small cell lung cancer (NSCLC): Results from a phase 1 expansion cohort.

Subjects' views on compensation for donating biospecimens.

Radiation Therapy for Stage III Lung Cancer: What Is the Role of Proton Therapy?

Association of higher lung dose received during total body irradiation for allogeneic hematopoetic stem cell transplantation in children with acute lymphoblastic leukemia with inferior progression-free and overall survival: A report from the Children’s Oncology Group.

A phase I study of gemcitabine and bendamustine in relapsed/refractory Hodgkin's lymphoma.

Lymphoma Epidemiology and Survivorship

Phase I study of ganetespib (G), capcitabine (C), and radiation (RT) in rectal cancer.

Phase IIb study of pasireotide (P), everolimus (E), and selective internal radioembolization therapy (SIRT) for unresectable neuroendocrine hepatic metastases.

A randomized, phase III study (FLAURA) of AZD9291, a novel EGFR-TKI, versus gefitinib or erlotinib in treatment-naïve patients with advanced non-small cell lung cancer (NSCLC): Results from a phase 1 expansion cohort.
